

ACCELERATING DIGITAL LEGAL AID SERVICES IN BANGLADESH (ADLASB) PROJECT

FINAL CASE

FIVE DOORS, ONE RECORD

Grand Finale Case | All-Mandatory Integrated Challenge
Digital Legal Aid for the Future: Building Justice for Every Citizen

THE FINAL QUESTION

Can one digital legal-aid architecture serve five very different citizens, support seven different provider roles, and integrate eleven advanced technical challenges - without fragmenting the case record or replacing human judgment?

BUILD ONE SYSTEM - NOT TWENTY-THREE ISLANDS.

THE ASSIGNMENT

Build one integrated DLAS prototype that incorporates ALL five Part A citizen scenarios, ALL seven Part B provider scenarios, and ALL eleven targeted technical challenges. The prototype must use one shared record architecture, common services and a traceable workflow rather than separate mini-projects.

At a glance

Item	Requirement
Solution paper	26 September 2026, 11:59 PM PDF maximum 2 pages / 1,000 words
Final submission	27 September 2026, 8:00 AM pitch deck + public prototype URL + 90-second fallback recording
Grand Finale	27 September 2026 10-minute pitch + 10-minute jury Q&A
Prototype standard	Working integrated prototype; labelled simulations are acceptable only for external integrations that cannot reasonably be connected live
Mandatory scope	5 citizen scenarios + 7 provider scenarios + 11 targeted technical challenges = 23 mandatory requirements

READ THIS FIRST - WHAT 'MANDATORY' MEANS

MANDATORY COVERAGE	WHAT THIS MEANS
Part A - 5 citizen scenarios	Moyuri, Ripon, Nabila, Nuching and Malek must all be supported by the same solution architecture.
Part B - 7 provider scenarios	DLAO officer; Legal Aid Officer/Mediator; 16699 helpline agent; UDC entrepreneur; panel lawyer; receiving DLAO; and DLAO administrative/case-support staff must all be supported.
Part C - 11 targeted technical challenges	Every technical challenge must be implemented and connected to the DLAS workflow and shared record.
One integrated record	Reuse the same Application ID / Case ID, data model, permissions, task engine, document history, audit trail and workflow services.
Live demonstrability	All 23 requirements must be reachable and testable. The 10-minute pitch should combine them into a small number of integrated flows; the jury may inspect any item during Q&A.

CLARITY RULE: Everything is mandatory; duplication is not. Reuse common components wherever the same capability solves several scenarios.

Prototype standards

Term	Meaning for this challenge
Working	The core logic genuinely functions with sample data and changes system state.
Simulated integration	An external service may be represented by a clearly labelled mock/simulator, but the team's own workflow, state transition and audit entry must work.
Concept-only	A slide, wireframe or verbal explanation without working logic does not count as implementation.
Testable	A juror can open the scenario/module, trigger the relevant action and observe the expected result.

How to think about the challenge

Layer	Mandatory content	Question to answer
1. Citizen access	Five doors + all five Part A scenarios	Can every person reach or remain connected to legal aid despite their specific constraint?
2. Service delivery	All seven Part B provider scenarios	Can each provider see the right information, take the right next action and hand work onward without creating parallel records or extra administrative burden?
3. Technical capability	All eleven targeted technical challenges	Can the architecture handle the advanced case-management, AI and resilience problems the case requires?
4. Governance & trust	Safety, privacy, accessibility, provenance, human authority and audit	Can every consequential action be explained, corrected, controlled and traced?

The common backbone

ENTRY CHANNEL -> APPLICATION ID -> VERIFICATION / REVIEW -> CASE ID -> MEDIATION / LAWYER / REFERRAL / OTHER SERVICE -> FOLLOW-UP -> OUTCOME -> CLOSURE

- An Application ID is created at submission.
- A Case ID is created only after acceptance and remains with the case through referral, mediation, lawyer assignment and closure.
- Contact-safety rules, representation status, document history, permissions and audit history follow the record.
- Every provider uses a role-appropriate view of the same authoritative record.
- Every technical module must write back to the same record rather than create a disconnected side system.

HOW TO BUILD THIS: SIX FLOWS, ONE SYSTEM

All 23 requirements must exist in the prototype. You are not expected to narrate 23 separate demonstrations. The strongest solution will combine them into connected end-to-end flows and reuse common services.

Integrated flow	Mandatory content it can demonstrate
1. Safe & accessible intake	Moyuri + Ripon + 16699 agent + T5 Conversational Intake + representation + safe contact + screenless/accessibility route
2. Assisted, low-bandwidth & offline intake	Nuching + UDC entrepreneur + case-support staff + T6 Document Agent + T9 Offline Sync + T10 PWA
3. DLAO daily operations	DLAO officer + case-support staff + T3 Related Incident Cases + T4 Duplicate Detection + T8 Multi-Agent Triage + daily action view
4. Mediation & settlement	Legal Aid Officer/Mediator + scheduling/notices/documents + remote/hybrid participation + T7 Settlement Drafting + T11 E-Signature
5. Urgent referral & receiving office	Nabila + DLAO officer + receiving DLAO + tracked referral + T2 jurisdiction escalation + sensitive access
6. Long-running case & lawyer accountability	Malek + panel lawyer + DLAO officer + T1 Lawyer Change/Pattern Alert + hearing/update reminders + citizen status

JURY RULE: Any Part A scenario, Part B provider role or Part C technical challenge may be selected for a live check. Every mandatory item should therefore be reachable, connected and testable even if it is not narrated in the 10-minute pitch.

Five doors into the same record

Door	Who it must work for	System implication
16699 / IVR / voice	People who can speak/use a keypad but may not read	Voice-first intake/status; confirmation/read-back; safe contact; human handoff
USSD / SMS	Basic phones; weak/no data	Short flows; low data dependency; neutral/privacy-aware messages
Web / mobile	Independent digital users	Bangla-first; accessible; low-bandwidth; save/resume
Assisted access	UDC / authorised helper / representative	Consent; provenance; bounded permissions; audit trail
DLAO / referral route	Walk-ins and institutional routes	Same record; no re-entry; structured handover and acknowledgement

CHANNEL RULE: A channel is an interface, not a separate case-management system.

PART A - FIVE CITIZEN SCENARIOS

The five personas are mandatory and are not alternatives. Your prototype must show how the same architecture resolves each person's specific barrier. Shared components may be reused, but each persona's problem must be visibly resolved.

A1. Moyuri Akter - Joypurhat

Situation	Must be solved	Minimum evidence
Her husband controls the smartphone; her button phone is checked; her NID is inaccessible; her brother Ripon called 16699; the office has not heard her own account.	Unsafe contact; incomplete identity; representation; second-hand information.	Her application progresses safely; Ripon's report is distinct from Moyuri's confirmation; safe channel/number/time and neutral wording are enforced; Moyuri can later correct or withdraw information. Failure test: an unsafe person answers the phone.

A2. Ripon - authorised representative

Situation	Must be solved	Minimum evidence
Ripon is blind and can use calls/voice but cannot independently use visual forms, PDF, CAPTCHA or visual OTP.	Blind access; authentication; representation authority; non-visual status.	Ripon completes one meaningful Bangla task independently; scope/status of authority is visible; the record shows what Moyuri has and has not confirmed. Accessibility test: complete without a sighted helper.

A3. Nabila - Jhenaidah

Situation	Must be solved	Minimum evidence
A former classmate is using fake/altered images and pressuring her. The harm is spreading and some response may require another competent authority.	Urgency; highly sensitive evidence; role-restricted access; referral.	Urgency is surfaced for human review; sensitive material is restricted; referral includes reason/history/documents, acknowledgement, deadline and escalation. Failure test: receiving authority does not acknowledge.

A4. Nuching Marma - Khagrachari

Situation	Must be solved	Minimum evidence
Nuching cannot read; speaks Marma and limited Bangla; a UDC entrepreneur types/photographs documents and uses his own number; connectivity is unreliable.	Assisted access; translation/provenance; consent; document quality; offline resilience.	The record distinguishes what Nuching said from what was translated/taped; assistance and consent are recorded; UDC access is bounded; document problems are visible; work survives network loss. Failure test: network drops halfway through submission.

A5. Abdul Malek - Barguna

Situation	Must be solved	Minimum evidence
His case is seven months old; hearing dates were learned informally; the number on file belongs to a shop; travel costs wages; panel-lawyer updates are missing.	Long-running case; unstable contact; low literacy; status access; lawyer accountability.	Malek can obtain status/next step without smartphone or reading; failed contact attempts are logged; overdue lawyer updates surface before he travels. Failure test: panel lawyer misses two updates.

PART B - SEVEN PROVIDER SCENARIOS

Part B follows the people who turn applications into actual legal-aid service. The objective is not merely to digitise their existing work. Each provider should receive the right role-based view, know the next action, and hand work onward through the same authoritative case record.

B1. DLAO officer

Challenge today	Outcome the system must achieve	Minimum evidence
Starts the day with a growing caseload but no single view of new, incomplete, urgent, pending or overdue matters. Files, registers, calls and messages must be checked separately, while status enquiries interrupt casework.	A unified operational view showing new, pending, overdue and priority matters, with reasons for every flag; searchable history; reminders and ageing alerts; final prioritisation remains with the officer.	Open a realistic queue; identify what needs attention today and why; drill into history; override one system recommendation and see the override recorded.

B2. Legal Aid Officer / Mediator

Challenge today	Outcome the system must achieve	Minimum evidence
Pre-case mediation requires registration, party contact, date fixing, document review, attendance, mediation and outcome preparation. Repeated travel can increase cost, lost work time and non-attendance.	An integrated mediation workflow with scheduling, notices, documents, reminders, attendance and outcome recording; remote/hybrid participation where legally and practically appropriate; in-person fallback retained.	Move one matter from registration -> scheduling/notices -> attendance/documents -> mediation -> outcome. Demonstrate a remote/hybrid option and a clear in-person fallback.

B3. 16699 helpline agent

Challenge today	Outcome the system must achieve	Minimum evidence
Explains the same procedures repeatedly and may not know whether a caller already applied, has mediation pending, was referred or is waiting for a lawyer. The caller may repeat the story several times.	Case/Application ID look-up and Bangla intake/status interface using the same record as the DLAO.	Look up an existing case and show the permitted current status/next step; create a new assisted intake that writes to the same record rather than a separate note.

B4. UDC entrepreneur

Challenge today	Outcome the system must achieve	Minimum evidence
Helps low-literacy or digitally excluded users complete forms but may not know document requirements. The entrepreneur's phone may be used, creating later authentication/contact problems. Applicants may not know the service is free.	Assisted-intake mode with case-type checklist, free-service notice, provenance/consent, safe/applicant contact where available, limited post-submission access and weak-network support.	Submit an assisted application showing who assisted, what was consented to, required-document checklist, safe contact, free-service notice, limited post-submission access and recovery from network loss.

B5. Panel lawyer

Challenge today	Outcome the system must achieve	Minimum evidence
Receives assignments through paper, phone or informal communication and lacks a single view of assigned matters, deadlines or hearing dates. Updates rely on calls and manual follow-up.	One assignment/worklist view with case documents, hearings, deadlines and required updates; digital accept/decline and progress reporting; overdue reminders; safe client notifications linked to the case.	Lawyer accepts an assignment, sees a hearing date, submits an update, then misses a later deadline; the DLAO receives an overdue alert without a chase call.

B6. Referral Receiving DLAO

Challenge today	Outcome the system must achieve	Minimum evidence
Receives an inter-district referral with limited history, unclear reason or missing documents and must call the sending office to reconstruct the case. Neither office can reliably see whether it was received, accepted or acted upon.	Complete digital referral package with reason, history, documents, responsible actor and expected action; acknowledgement and status visible to both offices and, where appropriate, the seeker.	Referral arrives with complete package; receiving DLAO acknowledges/accepts/returns; both offices see status; non-acknowledgement triggers follow-up.

B7. DLAO administrative / case-support staff

Challenge today	Outcome the system must achieve	Minimum evidence
Spend significant time maintaining registers, locating physical files, re-entering information, preparing reports and answering requests for statistics. Knowledge can be lost when staff or files move.	Structured digital case record from intake to closure, with search, version history, task status and reportable fields captured once and reused.	Search and reconstruct a case without physical-file hunting; generate one routine status/reporting view from data already captured in the case record.

PART B DESIGN RULE: A helpline note, UDC intake, mediator action, lawyer update, referral acknowledgement or administrative report should update or reference the SAME authoritative case record - not create a second version of the case.

PART C - ELEVEN TARGETED TECHNICAL CHALLENGES

All eleven technical challenges are mandatory. They are not eleven separate products; they are stress tests of the architecture. The strongest solution will make them reinforce one another.

Examples: the document agent should improve the officer's file; offline sync should preserve the UDC journey; triage should improve the DLAO action queue; e-signature should complete the mediation journey.

Mandatory integration map

Challenge	Natural anchor	Reusable service
T1 Lawyer change / inactivity	Malek + DLAO officer + panel lawyer	Panel-lawyer management; task/escalation; payment status
T2 Jurisdiction ping-pong	Nuching + DLAO officer + referral receiving DLAO	Referral/routing; acknowledgement; escalation
T3 Multiple applicants / one incident	DLAO officer + case-support staff	Case-linking; controlled shared evidence
T4 Duplicate detection	DLAO officer + case-support staff	Search/matching; human review; audit
T5 Conversational Bangla intake	Moyuri/Ripon/Nuching + 16699 + UDC	Intake; accessibility; provenance; human handoff
T6 Document briefing/checklist	DLAO officer + UDC + case-support staff	Document service; source references; missing-item checks
T7 Settlement drafting	Mediator workflow	Template/drafting; human review; audit
T8 Multi-agent triage	DLAO officer	Categorisation; rules; priority/routing recommendation
T9 Offline-first sync	Nuching + UDC + case-support staff	Local queue; idempotent sync; conflict review; audit
T10 Low-bandwidth PWA	Citizen-facing web/mobile + UDC	Performance; light mode; safe caching
T11 Asynchronous e-signature	Mediator + settlement parties	Signing; sync; integrity verification

Case-management challenges

T1. The Lawyer Who Doesn't Answer

Problem	Mandatory build	Acceptance test	Guardrail
Marzina Begum's panel lawyer has stopped updating her, missed two hearings and shows similar inactivity on two other cases.	Citizen lawyer-change request -> DLAO queue -> human review/reassignment -> stage-based payment reconciliation -> separate repeated-inactivity review alert.	Show request, officer review, reassignment, payment-status update and a separate pattern alert based on the defined threshold.	Pattern detection may trigger review; it does not itself establish misconduct or a recoverable amount.

T2. Jurisdiction Tug-of-War

Problem	Mandatory build	Acceptance test	Guardrail
Rahim Mia's compensation matter is repeatedly transferred between a DLAO and Labour Legal Aid Cell.	Detect repeated transfer/return -> acknowledgement/return reason -> escalation -> authorised human makes final routing decision.	After two rejected/returned transfers, show escalation and the human decision that determines the route.	The system escalates; it does not make the legal jurisdiction decision.

T3. Multiple Applicants, One Incident

Problem	Mandatory build	Acceptance test	Guardrail
Salma Begum and co-workers file separate claims arising from the same factory fire and share some evidence.	Link separate cases into a related-incident group; upload common evidence once; provide group-level view while preserving separate records.	Create three linked cases; upload one common document once; show it across the group without merging case-specific information.	Link, do not merge. Confidentiality, instructions and outcomes remain case-specific.

T4. Duplicate / Fraud-Risk Detection

Problem	Mandatory build	Acceptance test	Guardrail
Similar names/details may indicate repeated applications, while two real people may look similar.	Fuzzy matching using multiple attributes; confidence/evidence display; side-by-side human review.	Run 10-15 demo records including genuine duplicate candidates and at least two similar-but-different trap cases.	Never auto-reject, auto-merge or label a person fraudulent.

AI / agentic-AI challenges

T5. Conversational Intake Agent

Problem	Mandatory build	Acceptance test	Guardrail
A form wizard is difficult for low-literacy or unfamiliar users.	Natural Bangla multi-turn intake; slot-fill approved fields; ask clarifying questions; call approved rule/tools; preserve provenance; hand sensitive/ambiguous cases to a human with context.	Demonstrate one straightforward intake and one sensitive/ambiguous case that is handed to a human with context.	AI may explain/check published rules; it does not decide eligibility. Extracted facts must remain traceable and confirmable.

T6. Document Summarization & Checklist Agent

Problem	Mandatory build	Acceptance test	Guardrail
Officers must read deeds, medical reports, photos and court papers and manually identify missing items.	Analyse 5-6 sample documents; produce a concise briefing; compare with a case-type checklist; flag missing/uncertain items; source every material summary point.	Use 5-6 documents, including one deliberately missing item and one unclear/unreadable item.	Unclear content must be surfaced, not guessed. The officer verifies the briefing.

T7. Settlement Agreement Drafting Assistant

Problem	Mandatory build	Acceptance test	Guardrail
Mediators need tailored drafting for maintenance, property or labour settlements.	Turn mediator notes into a draft grounded in approved templates/examples; mark AI-filled/inferred sections; flag internal inconsistencies; require explicit human review.	Generate drafts for maintenance, property and labour scenarios; visibly mark AI-inferred text and at least one inconsistency warning.	The output is a draft. Human legal review, party understanding/consent and applicable formalities remain mandatory.

T8. Multi-Agent Case-Triage Pipeline

Problem	Mandatory build	Acceptance test	Guardrail
A single priority flag is not enough for category, urgency, jurisdiction and process checks.	Use at least three specialised components/agents for categorisation, compliance/process checks and orchestration; surface structured reasons/evidence and conflicts.	Run at least five sample cases; include one case where agents/components disagree and the conflict is surfaced for human review.	Explainability means concise reasons/evidence, not hidden chain-of-thought. Final priority/routing remains human-reviewable.

Advanced technology & resilience challenges

T9. Offline-First, Integrity-Verifiable Sync

Problem	Mandatory build	Acceptance test	Guardrail
UDCs and offices may lose connectivity for hours while handling sensitive applications.	Create applications offline with temporary UUIDs; sync later without duplicates; route conflicting edits to human review; demonstrate integrity verification.	Create three records offline -> reconnect/sync -> show no duplicate -> simulate one conflict -> run integrity verification.	State the threat model and assumptions. Do not claim absolute tamper-proofing.

T10. Low-Bandwidth Progressive Web App

Problem	Mandatory build	Acceptance test	Guardrail
Rural users may have older low-RAM Android devices and unstable/expensive data.	Installable PWA; safe offline caching; adaptive/light mode; testing under throttled network and constrained-device assumptions.	Demonstrate normal and light mode under the same throttled profile and report simple load/interaction measures.	Do not indiscriminately cache sensitive data on shared devices; explain cache/encryption/exclusion/logout choices.

T11. Offline-Capable Secure E-Signature

Problem	Mandatory build	Acceptance test	Guardrail
Settlement parties may sign at different times and one may be offline.	Asynchronous signing linked to the mediation record; offline-then-sync; cryptographic verification of signature and document integrity; independent verification method.	Two parties sign at different times, one offline; sync later; verify signatures and show that the signed document has not changed.	Cryptographic validity does not by itself establish legal validity, identity, capacity, informed consent or enforceability.

RESPONSIBLE-DESIGN RULES

Area	Non-negotiable rule
Human authority	Eligibility, rejection, final priority, legal judgment, consequential referral, final lawyer assignment, mediation outcome and closure remain with authorised humans.
Provenance	Applicant-confirmed, representative-reported, intermediary-translated, staff-entered and AI-inferred information must be distinguishable.
Privacy / safety	Collect only what is needed; apply role-based access; enforce safe contact; keep material access/change history.
Accessibility	Bangla-first demonstrated interfaces; accessible labels, focus, errors and zoom; equivalent route where a visual-only step would exclude.
Failure handling	Every module must fail visibly and safely through uncertainty, retry, handoff, escalation or human review rather than silent error.
Workflow fit	Every module must connect to the same DLAS record, IDs, tasks and audit history.
Sample data	Use illustrative data only. Do not use real NID numbers, real cases, real beneficiary records, live payments or a live 16699 call.

THE GOLDEN THREAD – Compatibility and Interoperability Checklist

The 23 mandatory items tell you what the prototype must contain. The Golden Thread tells you how those items must behave. It does not add ten separate modules.

#	Requirement	Pass condition
G1	One record, many doors/providers	Channels and provider roles touch the same record; history shows source, role and handover.
G2	Representation & provenance	Who spoke/typed/translated/inferred/confirmed is visible; authority status is visible.
G3	Safe contact	Unsafe contact can be blocked/delayed with a recorded reason.
G4	Accessibility & inclusion	Relevant task is usable through the required accessible/non-screen/assisted route.
G5	Human control	Consequential recommendation can be reviewed/corrected/overridden; human authority is recorded.
G6	Complete file & document control	Missing/uncertain/latest-version/duplicate issues are surfaced without silent merge or guessing.
G7	Tracked responsibility	Mediation, referral, lawyer, task and deadline show owner, status and next action.
G8	Resilience	Weak network/offline/retry/conflict paths do not silently lose or duplicate records.
G9	Role-based privacy	Each role sees what it needs - no more - and access boundaries persist across handovers.
G10	End-to-end audit	Jury can reconstruct who did what, when, through which channel/provider role and on whose authority.

MANDATORY COVERAGE CHECKLIST - 23 ITEMS

ID	Mandatory item	Team check
A1	Moyuri - safe contact, identity gap, representation	☐ Implemented ☐ Integrated ☐ Testable
A2	Ripon - blind access and independent status/task	☐ Implemented ☐ Integrated ☐ Testable
A3	Nabila - urgency, sensitive access, tracked referral	☐ Implemented ☐ Integrated ☐ Testable
A4	Nuching - assisted access, language/provenance, offline	☐ Implemented ☐ Integrated ☐ Testable
A5	Malek - long-running status, unstable contact, lawyer follow-up	☐ Implemented ☐ Integrated ☐ Testable
B1	DLAO officer - operational view, backlog, priority, follow-up	☐ Implemented ☐ Integrated ☐ Testable
B2	Legal Aid Officer/Mediator - end-to-end mediation + remote/hybrid option	☐ Implemented ☐ Integrated ☐ Testable
B3	16699 helpline agent - shared case look-up + Bangla intake/status	☐ Implemented ☐ Integrated ☐ Testable
B4	UDC entrepreneur - assisted intake + checklist + safe contact + free-service notice	☐ Implemented ☐ Integrated ☐ Testable
B5	Panel lawyer - assignment/worklist + hearings/deadlines + updates	☐ Implemented ☐ Integrated ☐ Testable
B6	Receiving DLAO - complete referral + acknowledgement/status	☐ Implemented ☐ Integrated ☐ Testable
B7	Administrative/case-support staff - structured record + search + reporting continuity	☐ Implemented ☐ Integrated ☐ Testable
T1	Lawyer change + repeated inactivity + payment reconciliation	☐ Implemented ☐ Integrated ☐ Testable
T2	Jurisdiction ping-pong + escalation	☐ Implemented ☐ Integrated ☐ Testable
T3	Related incident cases + shared evidence	☐ Implemented ☐ Integrated ☐ Testable
T4	Duplicate detection + human review	☐ Implemented ☐ Integrated ☐ Testable
T5	Conversational Bangla intake agent	☐ Implemented ☐ Integrated ☐ Testable

ID	Mandatory item	Team check
T6	Document summary/checklist agent	☐ Implemented ☐ Integrated ☐ Testable
T7	Settlement drafting assistant	☐ Implemented ☐ Integrated ☐ Testable
T8	Multi-agent triage pipeline	☐ Implemented ☐ Integrated ☐ Testable
T9	Offline-first sync + conflict/integrity handling	☐ Implemented ☐ Integrated ☐ Testable
T10	Low-bandwidth PWA	☐ Implemented ☐ Integrated ☐ Testable
T11	Asynchronous secure e-signature	☐ Implemented ☐ Integrated ☐ Testable

Deliverables and deadlines

#	Deliverable	Deadline	Required content
1	Solution paper	26 Sep, 11:59 PM	PDF max. 2 pages / 1,000 words architecture + integration map + coverage + what was built
2	Pitch deck	27 Sep, 8:00 AM	PPTX/PDF prototype URL + QR code on slide 1
3	Live prototype	27 Sep, 8:00 AM	All 23 mandatory items reachable and testable
4	Fallback recording	27 Sep, 8:00 AM	MP4 max. 90 seconds core integrated flow

Solution paper - required structure

- System architecture: how Part A, Part B and the eleven technical challenges share records/services.
- Coverage map: where each of the 23 mandatory items is implemented.
- Human-control and safeguarding model: what technology assists and what authorised people decide.
- Failure/resilience model: how offline operation, uncertainty, conflict, unsafe contact and unsuccessful handovers are handled.
- Five proposed success indicators.

10-minute pitch - recommended structure

Time	Show
1 min	Architecture: one system, four layers, 23 mandatory items.
6 min	Integrated flows covering the five citizens, seven provider roles and eleven technical modules.
1 min	One planned Bad Day failure/recovery.
1 min	Provider workload reduction + citizen inclusion/safety payoff.
1 min	Feasibility, DLAS workflow fit, scaling and metrics.

Judging

Criterion	Weight	What the jury is looking for
System integration & architecture	20%	One coherent architecture; shared records/services; clear state transitions; no disconnected feature islands.
Technical quality & reliability	20%	Working implementation, data/state coherence, failure handling, source traceability and sound engineering.
Practical service improvement / legal impact	15%	Meaningful improvement to access and provider work without bypassing legal requirements.
Innovation	10%	Creative solution design beyond simply reproducing existing forms or workflows.
Inclusion & accessibility	10%	The system holds under disability, low literacy, assisted access, weak devices and language/connectivity constraints.
Privacy, safety & responsible AI	10%	Safe contact, bounded access, provenance, human authority, explainability and audit.
Feasibility, interoperability & scalability	10%	Can fit DLAS workflow, provider operations and scale beyond pilots.
Presentation & multidisciplinary teamwork	5%	Clear demonstration and coherent legal/technical/design/governance reasoning.

ANNEX A - QUICK GLOSSARY

Term	Meaning
ADLASB	Accelerating Digital Legal Aid Services in Bangladesh project
DBLA	Directorate of Bangladesh Legal Aid
DLAS	Digital Legal Aid System
DLAO	District Legal Aid Office / Officer, depending on context
UDC	Union Digital Centre - assisted service point
16699	Legal-aid helpline / IVR route used in the challenge
Application ID	Identifier created when an application is submitted
Case ID	Identifier created after acceptance into the legal-aid case workflow
Provenance	Who supplied, typed, translated, inferred, confirmed or changed information
Golden Thread	Cross-cutting behaviours that must remain consistent across all scenarios and modules

ANNEX B - WORKFLOW MAPS

Every mandatory scenario and technical challenge must map to one or more DLAS workflow blocks or cross-cutting services. Teams should identify these mappings in the solution paper and be ready to show them during Q&A.

B1. Existing DBLA legal-aid workflow - current process

B2. DLAS comprehensive end-to-end workflow (Indicative)

DLAS – Comprehensive End-to-End Workflow

From Application to Access to Justice
